Required libraries or framework?

- OpenCV - for loading images, saving, and CPU baseline implementations

Any potential risks or technical problems/challenges?

- Memory management may be a problem for this project.
- Loading medical images and initializing them properly may be a challenge at the start.
- Getting the right kernel sizes for different x ray images

What is your plan/outline of your project?

- First blur, sharpen, and edge detect the image
- Then apply color grading
- Then apply chain filters to isolate bone structure in x ray images.

- Each filter is a separate CUDA kernel to implement.
- First, be able to load an image using OpenCV and apply a gaussian blur kernel to it.
- Next, create the Sobel edge detection kernel
- Next implement sharpening kernel.
- Implement color mapping to make bones more visual
- Chain these interactions together to work sequentially.
